13. ABSTRACT *(Maximum 200 words)*

The *Cape Photographic Durchmusterung* (CPD, Gill and Kapteyn 1895–1900) is a photographic survey of southern stars in the declination range –18 to –90 degrees. This volume covers the declination range –53° through –89°. Positions are given for the 1875 equinox. The summary of the positional uncertainties quoted in the third volume of the published catalog gives ± 0.28 sec (R.A.), ± 0.044 arcmin (Dec.) for zones –18 to –57 degrees, ± 0.157 sec + 0.0764/cos (δ) sec (R.A.), ± 0.056 arcmin (Dec.) for zones –58 to –85 degrees, ±0.157 sec + 0.0353/cos (δ) sec (R.A.), ± 0.0127 arcmin (Dec.) for the polar plate where, as explained in the introduction to the third volume, many positions were derived from rectangular coordinates (these are positions reported to 0.1 sec (R.A.) and 0.001 arcmin (Dec.) in the –86 to –89 degree zones in the catalog). The probable error of a photographic magnitude, as determined by combining results for different magnitudes and weighting proportionately according to the numbers of stars in each class of magnitude, is given as ± 0.055 mag. From an analysis of the faint magnitude limits on the plates discussed in the third volume introduction, the catalog as a whole can be considered complete to photographic magnitude 9.2, but it is stated that it will be found practically complete, in or near the Milky Way, to magnitude 9.5.
